

# Course: Data Structures and Algorithms (DSA)

Course Code: CS110

Credit:4

## Course Description:

The course delves into the fundamental components of efficient and effective programming: data structures and algorithms. It covers essential data structures such as arrays, linked lists, trees, and graphs, highlighting their unique strengths and limitations. The course discusses essential algorithms for tasks such as searching, sorting, and traversing. It also examines techniques to analyze the time and space complexity of algorithms. Throughout the course, there will be extensive implementation of these algorithms in Python, not only enhancing students' programming skills for solving real-world problems but also sharpening their analytical and critical thinking abilities.

**Prerequisite(s):** Basic Programming Skills in C/C++/ Python

**Note:** Syllabus changes yearly and may be modified during the term itself, depending on the circumstances. However, students will be evaluated only on the basis of topics covered in the course.

## Course Objectives:

- Analyze the performance of algorithms
- Introduce fundamental data structures
- Explain the characteristics and trade-offs of different data structures
- Develop proficiency in designing and implementing various types of algorithms
- Apply data structures and algorithms to solve real-world problems
- Promote problem-solving skills: Analytical thinking, logical reasoning, algorithmic design.

## Course Outcomes:

- Analyze the time and space complexity of algorithms using Big O, Omega, Theta notations.
- Demonstrate understanding of different data structures and their operations.
- Choose the appropriate data structure for a given problem based on its characteristics and constraints.
- Implement common data structures and algorithms efficiently in chosen programming language (Python).
- Design and develop own algorithms for specific tasks.
- Improve problem-solving skills through algorithmic thinking and reasoning.
- Communicate algorithms and solutions effectively in written and verbal forms.

## Approximate weightage of different components in evaluation:

Assignments/Tests	20%
Midterm Exam	30%
Final Exam	50%

## Course Policies:

### General

1. Computing devices are not to be used during any exams unless instructed to do so.
2. Quizzes and exams are closed books and closed notes.
3. Quizzes are unannounced but they are frequently held after a topic has been covered.
4. ***No makeup quizzes or exams will be given.***

### Attendance and Absences

1. Attendance is expected and will be taken each class. Students are not supposed to miss class without prior notice/permission. Any absences may result in point and/or grade deductions.
2. Students are responsible for all missed work, regardless of the reason for absence. It is also the absentee's responsibility to get all missing notes or materials.

### Textbooks(s):

1. Data Structures and Algorithms in Python (An Indian Adaptation )  
*Michael T. Goodrich, Roberto Tamassia, Michael H. Goldwasser*
2. Introduction to Algorithms, 4<sup>th</sup> edition  
*Thomas H. Cormen, Charles E. Leiserson, Ronald Rivest, Clifford Stein*
3. Algorithms, 4<sup>th</sup> Edition  
*Robert Sedgewick and Kevin Wayne*

## Course Outline (tentative) and Syllabus:

The weekly coverage might change as it depends on the progress of the class. Each week assumes 4 hour lectures. Quizzes will be unannounced, so students should maintain close to 100% attendance.

Week	Content
Week 1	<ul style="list-style-type: none"><li>• Introduction</li><li>• Algorithm Analysis, Asymptotic Analysis - <math>O</math>, <math>\Omega</math>, <math>\theta</math>, <math>o</math>, <math>\omega</math></li></ul>
Week 2	<ul style="list-style-type: none"><li>• Problem solving session</li><li>• Recursion, Analyzing Recursive Algorithms, Tower of Hanoi, Recursion types, tail recursion,</li><li>• Introduction of the Divide and Conquer paradigm of algorithm design: merge sort, binary search, Master theorem</li></ul>
Week 3	<ul style="list-style-type: none"><li>• Array-Based Sequences, Python's Sequence Types</li><li>• Dynamic Arrays and Amortization, Efficiency of Python's Sequence Types</li><li>• Multidimensional data</li></ul>
Week 4	<ul style="list-style-type: none"><li>• Stacks</li><li>• Queues, and Deques</li></ul>
Week 5	<ul style="list-style-type: none"><li>• Quiz 1</li><li>• Linked Lists</li></ul>
Week 6	<ul style="list-style-type: none"><li>• Trees</li><li>• Tree Traversal Algorithms</li></ul>
Week 7	<ul style="list-style-type: none"><li>• Priority Queues</li><li>• Heaps</li></ul>
Week 8	<ul style="list-style-type: none"><li>• Maps, Hash Tables</li><li>• Review for Midterm exam</li></ul>
Week 9	<ul style="list-style-type: none"><li>• Search Trees - Binary Search, AVL, Splay, and Red-Black Trees</li></ul>
Week 10	<ul style="list-style-type: none"><li>• Sorting: Quick sort, Selection, Insertion, Randomized Quick-Select,</li><li>• Comparison of sorting algorithms</li></ul>
Week 11	<ul style="list-style-type: none"><li>• Graph Algorithms - Traversals, Shortest path, Minimum Spanning Trees</li></ul>
Week 12	<ul style="list-style-type: none"><li>• Text Processing - Pattern-Matching Algorithms</li><li>• Class test</li></ul>
Week 13	<ul style="list-style-type: none"><li>• Introducing the concept of Dynamic Programming and use of memoization</li><li>• Greedy Methods</li></ul>
Week 14	<ul style="list-style-type: none"><li>• Tries</li><li>• Union-Find data structure</li><li>• Quiz 2</li></ul>
Week 15	<ul style="list-style-type: none"><li>• Problem Session</li><li>• Review for Final Exam</li></ul>
